

Fundamentals of Experimental Design

What is measured during a controlled experiment?

Why?

Working in the science lab can be a lot of fun. Mixing random chemicals and burning stuff just to see what happens can be entertaining (and possibly dangerous), but it doesn't lead to anything helpful to the scientific community. In order to be helpful to the community, a researcher's work in the lab must be systematic. A researcher usually asks a question and then designs an experiment to investigate that question. In this activity you will identify different types of variables that will help you design controlled experiments.

Model 1 – Alka-Seltzer® and Vinegar

1. Briefly describe the reaction illustrated in Model 1 in one or more complete sentences.

Alka Seltzer was dropped into 23.5C 100mL diluted acetic acid. After alka Seltzer dissolve, the temperature of the acetic acid dropped.

2. Did the room pressure change as the reaction occurred? If yes, was there an increase or decrease?

no

3. What two pieces of evidence observed during the “mix” phase of the reaction suggest that a chemical change is taking place?

Bubbling, temperature change.

4. Did the solution temperature increase or decrease during the reaction?

Decrease

Model 2 – Results of Alka-Seltzer® Experiment

	Number of Alka-Seltzer Tablets	Volume of Vinegar (mL)	Room Pressure (kPa)	Initial Temp (°C) (Vinegar Solution)	Final Temp. (°C) (Final Mixture)
Trial 1	1	100.0	84	23.5	22.6
Trial 2	2	100.0	84	23.5	21.5
Trial 3	3	100.0	84	23.5	20.4
Trial 4	4	100.0	84	23.5	19.2
Trial 5	5	100.0	84	23.5	18.1

5. Which trial in the Model 2 data table corresponds to the reaction illustrated in Model 1?

1

6. Consider the five trials that produced the data in Model 2.

a. What variable was purposefully changed in the experiment?

Number of tablets

b. What variable changed as a result of changing the variable listed in part a?

Temperature

7. What variable(s) shown in the Model 2 data table remained constant among all the trials?

Initial acetic acid temp, pressure, volume of acetic acid

Model 3 – Boiling Points of Alcohols

Alcohol Name	Formula	Number of Carbons	Volume of Alcohol (mL)	Boiling Point (°C)	Room Pressure (kPa)
Methanol	CH ₃ OH	1	75	64.7	101
Ethanol	CH ₃ CH ₂ OH	2	75	78.4	101
Propanol	CH ₃ CH ₂ CH ₂ OH	3	75	97.1	101
Butanol	CH ₃ CH ₂ CH ₂ CH ₂ OH	4	75	117.7	101
Pentanol	CH ₃ CH ₂ CH ₂ CH ₂ CH ₂ OH	5	75	137.9	101

8. Describe the similarities and differences in the five alcohols used in the Model 3 experiment.

All have a CH₃ head and hydroxide tail group. More CH₂ links in between them

9. Consider the experiment that produced the data in Model 3.

a. What variable was purposefully changed in the experiment?

More CH₂ links aka longer alcohol molecule

b. What variable changed as a result of changing the variable listed in part a?

Boiling point

10. What variable(s) in the Model 3 data table remained constant among all the trials?

Pressure, volume

When designing an experiment, you need to consider three types of variables. The **independent variable** is changed by the experimenter by design. This variable is sometimes called the “manipulated variable.” The **dependent variable** is what changes as a result of the change in the independent variable. This variable is sometimes called the “responding variable.” In some cases more than one dependent variable is considered. The third category involves **controlled variables**. These are variables that you think might change the outcome of the experiment, but since you are not studying them, you need to keep them constant in each trial.

11. Identify the independent, dependent, and controlled variables for the experiments that produced the data shown in Model 2 and Model 3.

Model Experiment	Variables		
	Independent	Dependent	Controlled
Alka-Seltzer® and Vinegar	Number of tablets	Temperature	Pressure, initial temp, volume
Boiling Points of Alcohols	CH ₂ links	Boiling point	Pressure, volume

Read This!

A well-written research question states the independent and dependent variables for an experiment. For example, a student investigated the effect of the deicer, magnesium chloride, on vegetation on the sides of highways. Her research question was, “What is the effect of magnesium chloride solution concentration on the growth of rye grass?”

12. Write a research question, using the format suggested in the *Read This!* box, for the experiments in Models 2 and 3.

Alka-Seltzer® and Vinegar — Do the number of Alka-Seltzer tablets dissolved affect the ending temperature decrease of a vinegar solution?

Boiling Points of Alcohols — Do longer alcohol molecules result in a higher boiling point?

13. A student wonders, “Will changing the volume of alcohol in a boiling point experiment change the boiling point of the liquid?” Identify the variables that should be considered in this experiment.

Independent	Dependent	Controlled
Volume of alcohol	Boiling point	Pressure, alcohol type

Extension Questions

14. Many experiments designed to investigate the reaction of Mentos[®] with Diet Coke[®] have been documented on YouTube. Design and write an experiment that uses the knowledge gained in this activity to investigate this reaction. Include a research question; the independent, dependent and controlled variables; and a simple procedure.

Do the number of mentos affect the height of the jet of coke CO₂ mixture that shoots out during a reaction?

>I - number of mentos

>D - height of CO₂ mixture column

>C - type of bottle, temperature, pressure

5 same coke bottles, 1 2 3 4 5 mentos in each one. measure height of jet.

15. Scientists may design an experiment with a **control group**, which is a set of organisms or samples that do NOT receive the treatment (the independent variable) that is being tested. Scientists can then compare normal changes in organisms or samples with those that might have occurred because of the treatment. The idea of a “control group” is not the same as a “controlled variable.” Suppose a scientist is doing an experiment to determine the effect of a cancer drug on mice with lymphoma.

- a. What are some of the variables the scientist should control in the experiment?

Breed/type of mice, food the mice eat, general environment mice is in, etc.

- b. Describe the control group for this experiment.

Mice with a dose of 0 mg of cancer drug.
